Ivan Damjanov, Emanuel Rubin : Review of Pathology before purchasing it in order to gauge whether or not it would be worth my time, and all praised Review of Pathology:

This book contains over 2,000 questions that should help students test their knowledge and pinpoint areas for further study. This comprehensive text provides a close review of both general and systemic pathology, as well as covering key differences between normal and abnormal states and a variety of disease processes. A useful tool for the USMLE and FLEX, it also includes a self-test with colour gross photographs and micrographs like those found on standardized exams, questions pertaining to graphs to help students interpret visual data and helpful lists of "mosts" which include information such as "tumours that most often metastasize to the bones" and "most common cause of osteoporosis".
