Vibrio vulnificus is one of three pathogenic *Vibrio* spp. on which FAO and WHO have undertaken risk assessment work. This pathogen is associated primarily with raw oysters but can occur in a variety of seafood products. As well as causing gastrointestinal illness, *V. vulnificus* can cause primary septicemia which is a serious and often fatal disease in individuals with chronic pre-existing conditions. This volume provides an approach for undertaking quantitative risk assessment of *V. vulnificus* in raw oysters. This risk assessment model was also developed to evaluate the effectiveness of various interventions strategies aimed at reducing *V. vulnificus* levels in oysters and therefore the associated risk of illness.
